

# Aerial Fiber Optic Cable Laying Method

## Overview

Many different methods are used for cable installation. These include pulling, blowing, and pushing into ducts, direct burial, and aerial installation. Aerial optical fiber cables are hung on electric poles and are required to be able to adapt. It is important when installing aerial optical fibre cable lengths to make proper arrangement for an adequate extra length of cable at a pole position for testing and jointing. This length at each end of cable must be sufficient to enable construction of joints at a convenient work position and it. Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both. Aerial installation is generally much less costly than underground construction also. Fiber in a duct solutions have a major aesthetic. An aerial cable is an insulated cable usually containing all fibres required for a telecommunication line, which is suspended between utility poles or electricity pylons.

### How to Install Aerial Fiber Optic Cable

Aerial optical fiber cable is an optical cable laying on poles. This kind of laying method can use the original overhead wiring pole lines, saving construction costs and shortening the construction period.
