100 Gigabit Ethernet

OverviewEarly productsStandards developmentCommercial trials and deploymentsStandards100G interface typesChip-to-chip/chip-to-module interfacesPluggable optics standards

Optical signal transmission over a nonlinear medium is principally an analog design problem. As such, it has evolved more slowly than digital circuit lithography (which generally progressed in step with Moore's law). This explains why 10 Gbit/s transport systems existed since the mid-1990s, while the first forays into 100 Gbit/s transmission happened about 15 years later – a 10x speed increase over 15 years is far slower than the 2x speed per 1.5 years typically cited for Moore's law.
