

# Distance between the distribution box and the construction machinery

## Overview

Distribution box and switch box should not exceed 30 meters. However, we will advise on issues such as electrical safety clearances and the location of towers and cables. We also work with developers to minimise the impact of any National Regulations (ESQCR) 2002. A site power distribution board is usually an electrical distribution box equipped with various sockets to provide power for. Low-voltage distribution lines refer to the circuits that, through a distribution transformer, step down the high voltage of 10 kV to the 380/220 V level—i.e., the low-voltage lines running from the substation to the end-use equipment. Low-voltage distribution lines should be considered during the. Before beginning equipment operations, the employer must: Identify the work zone by either: Demarcating boundaries (such as with flags, or a device such as a range limit device or range control warning device) and prohibiting the operator from operating the equipment past those boundaries, or. The power distribution system at the construction site shall be distributed in different levels.
