

# Fiber Optic Cable Fusion Construction

## Overview

Fusion splicing is the process of fusing or welding two fibers together usually by an electric arc. Fusion splicing is the most widely used method of splicing as it provides for the lowest loss and least reflectance, as well as providing the strongest and most reliable joint between. This virtual hands-on page will take you through the steps involved in the process. Look at the slide graphics and then read the notes below. If you have your own equipment, do the recommended exercises. This will typically be 250 $\mu$ m for bare fibers and 900 $\mu$ m for coated fibers. Fiber optic cable transmit information as light pulses, rather than the electrical impulses used by traditional wire cables. They may be used to convey voice, video and data. The fiber optic cables have a glass core covered with cladding, coatings, and, typically, Kevlar membranes to add strength. Let's explore the fundamentals of mechanical and fusion splicing, their comparative benefits, and the detailed process involved. Fiber optic cable for any given application is designed considering installation and environmental constraints and requirements of existing/newer communications and remote networks.
