

Fiber optic cable inside the ceiling

Overview

Indoor cables can be installed in raceways, cable trays above ceilings or under floors, placed in hangers, pulled into conduit or innerduct or blown through special ducts with compressed gas. The installation process will depend on the nature of the installation and the type. Fiber optic cables are categorized based on their deployment environment: indoor fiber optic cables and outdoor fiber optic cables. Each type is designed with specific features to ensure optimal performance under varying conditions. Indoor fiber optic cables are commonly used in buildings, offices. Modern home networking often relies on a Fiber-to-the-Home (FTTH) connection, which typically terminates at a service provider's external box. Any such damage may alter the cable's and/or connectors' transmission characteristics to the extent that the pre-connectorized cable may have to be replaced. Then, they will drill a small hole in an exterior wall to bring the cable into the house.
