

Fiber optic transmission topology includes

Overview

Fiber optic networks offer numerous advantages such as high bandwidth, long-distance transmission, and flexibility. When it comes to the topologies of optical fiber, there are several options to consider. Point-to-Multipoint (P2MP): Splitters are used to distribute a single fiber optic signal to multiple users, and they are commonly used in FTTH deployments. As the demand for high-speed and reliable connectivity continues to grow, understanding the different types of fiber optic network topologies. All networks involve the same basic principle: information can be sent to, shared with, passed on, or bypassed within a number of computer stations (nodes) and a master computer (server). Network applications include LANs, MANs, WANs, SANs, intrabuilding and interbuilding communications, broadcast. Point-to-point fiber links connected to electronic switching equipment High performance data communications. Serial HIPPI standard introduced, fiber at 1. These include a bus, with or without a backbone, a star network, a ring.
