

# How many meters of optical cable are needed for inspection

## Overview

For short distance tests, like FTTH cables using high resolution OTDRs, the cable can be as short as 50-100 meters. Perhaps the most important test is insertion loss of an installed fiber optic cable plant performed with a light source and power meter (LSPM) or optical loss test set (OLTS) which is required by all international standards to ensure the cable plant is within the loss budget before acceptance of. The Fiber Optic Association, Inc. (FOA) was founded in 1995 to help develop the workforce to build the fiber optic networks to support a rapid expansion in communications and the Internet. This type of testing is the most accurate testing available and is the most accurate characterization of the fiber optic system's capability. Industry standards like TIA/EIA provide strict limits for attenuation at connector pairs and splices: To ensure your fiber optic link meets these. The Contractor tasked to perform testing or splicing on any fiber optic cable will follow these testing standards to fulfill their contractual obligations. The Contractor must utilize the correct equipment and testing techniques to gain acceptance, or the work cannot be approved.
