

How to measure the delay of fiber optic cable

Overview

Accurate delay measurement is carried out using Optical Time Domain Reflectometers (OTDR), phase analyzers, and testers with group delay measurement functions, along with specialized software tools for modeling fiber parameters. Temporal delays or latency in optical fiber refer to the time it takes for a light signal to travel a certain distance from the source to the receiver. Despite the high data transmission speed, the signal does not propagate instantly and requires time to cover the distance. When transmitting over. Latency is a term that is used to describe a time delay in a transmission medium such as a vacuum, air, or a fiber optic waveguide. 792 meters per microsecond (μs) or 3. In fiber optics, the. Once the true velocity (v) of the light inside the fiber is known, calculating the latency (delay time) is a simple kinematic equation: $\text{Time} = \text{Distance} / \text{Velocity}$. Luna's Optical Backscatter Reflectometers (OBRs) operate on a principle known as optical.
