

# Multi-circuit three-level distribution box

## Overview

Connects to end-use equipment via switch boxes, forming a three-tier power distribution system. Residual current devices (RCDs) at both the tertiary (equipment-level) and secondary (zone-level) stages. Ensures safe disconnection in case of faults or leakage currents. In a newly constructed residential area, a 10kV power line is introduced into the substation. After stepping down the voltage through the transformer's low-voltage side (0.4kV), power distribution is achieved through three levels of distribution boxes: the main distribution board, secondary. Here, decentralized electrical installation has proven its worth: Our distribution boxes offer the necessary installation space for pluggable installation - for the most diverse applications in the most diverse areas of use: Our distribution box can be used wherever high demands and harsh. From the transformer's low-voltage side (0.4kV), power is routed to individual building distribution boxes (secondary distribution boxes), which subsequently supply power to unit-level distribution boxes. The three-phase distribution board is used to distribute power to the three-phase loads and circuits such as three-phase motors, three-phase machinery, three-phase to single-phase distribution boards, etc. Three-phase distribution boards are used in large factories, buildings, manufacturing units. Eaton's Pow-R-Line Xpert 3X (PRL3X) distribution panelboards provide a compact and flexible solution for electric power distribution with integrated breakers, metering and surge protection.
