

PLC beam splitter wavelength

Overview

PLC splitters feature low insertion loss, low PDL, high return loss and excellent uniformity over a wide wavelength range, from 1260nm to 1620nm and work in temperature from -40°C to +85°C. PLC splitter, also called Planar Waveguide Circuit splitter, is a device used to divide one or two light beams into multiple light beams uniformly or combine multiple light beams to one or two light beams. It is a passive optical device with many input and output terminals, especially applicable to. Light can be split by percentage of overall intensity, wavelength, or polarization state. Optical splitter has played an. Planar Lightwave Circuit (PLC) Splitters combine a silica glass waveguide process together with precision aligned fiber V-groove arrays to provide a reliable, low cost way to split light from one fiber into many fibers within a very small form factor package.
