

# Tail wire coil

## Overview

In electrical engineering, coil winding is the manufacture of electromagnetic coils. Coils are used as components of circuits, and to provide the magnetic field of motors, transformers, and generators, and in the manufacture of loudspeakers and microphones. The shape and dimensions of a winding are designed to fulfill the particular purpose. Parameters such as inductance, Q factor, insulation str. Terminology related to electric machines This article is about coil winding technology and much of the article is specific to electric machines. This section provides definitions of terms used later in the article. An electric motor or generator consists of a cylinderica. Efficient coils minimise the materials and volume required for a given purpose. The ratio of the area of electrical conductors, to the provided winding space is called "fill factor". Since round wires will always have some gap.
