

The cover of the distribution box is rusty

Overview

This complete guide explains what causes electrical panel corrosion, how to spot it early, and what you can do to stop it—plus the best products to help protect your system for years to come. Corrosion happens when moisture meets metal inside or around your breaker box. In order to prevent the rust of the distribution box, the following measures can be taken: Choose anti-rust materials: choose corrosion-resistant and anti-rust materials, such as stainless steel or galvanized steel sheets, to ensure that the surface of the cabinet is not easy to rust. A corroded electrical panel can lead to increased resistance, heat buildup, and even electrical. Should a panel be so heavily rusted that the metal is eaten through or so badly rusted that it can't be repainted; then give consideration to replacing the panel or the badly deteriorate parts. Rusted panels may have hazardous conditions on the inside of the panel. For most of my friends, I think stainless steel is not rusty. In fact, it's only relatively speaking. You should know that stainless steel is not the "King Kong is not bad body", it is just a strong corrosion. Rust is caused when metal is exposed to both moisture and oxygen, causing it to oxidize and become weaker.
