

The ground wire in the distribution box turns red

Overview

A hot ground wire occurs when the electrical current in the wire is running at a higher voltage than it should be. This can pose a major safety risk, and it's important to address it as soon as possible. The Equipment Grounding Conductor (EGC), commonly called the ground wire, should measure zero volts under normal. In most homes, a red wire marks a live hot conductor; in DC and electronics, red typically labels the positive side—always test before you touch. Color means something on every conductor. Red shows up in junction boxes, switch loops, ceiling fans, thermostats, speakers, alarms, and battery leads. They help electricians know which wire does what, and they prevent mistakes that could cause. The National Electric Code (NEC) is the standard used in the United States for color coding standard electrical wiring. It requires that each wire be identified by its own color for easy recognition.
