

What to do if the core switch keeps disconnecting

Overview

Replacing aging or malfunctioning components, conducting regular hardware inspections, and adhering to best practices for switch maintenance are essential for mitigating the impact of faulty network switches on network connectivity. I decided to perform a process of elimination by disabling ALL (except most critical) ports on the core switches and then re-enabling them in groups. Also worked with the server team and we narrowed it down to a server that is used for backups. Whenever a backup job would run and traffic started to. A network switch failure can disrupt business operations by causing connectivity issues, packet loss, and downtime for connected devices. I haven't been able to reproduce or find any patterns in when this occurs. Fortigate as a controller running a on 6. core switch connected as MCLAG Peers other access. It disconnects and reconnects so frequently that I literally cannot select my backup to restore my Roon Core after resetting the database and settings as it boots me out of the settings section every time I disconnect and reconnect. This happens about every 5 seconds. Please Help! Can you check if.
